

Economic review

February 2026 – review of January ⌚ 6 minute read

Our monthly economic review is intended to provide background to recent developments in investment markets as well as to give an indication of how some key issues could impact in the future.

It is not intended that individual investment decisions should be taken based on this information; we are always ready to discuss your individual requirements. We hope you will find this review to be of interest.

UK growth rate stronger than expected

Official figures released last month by the Office for National Statistics (ONS) showed the UK economy bounced back strongly in November, while survey data points to a further rise in economic momentum at the start of this year.

According to the latest monthly gross domestic product (GDP) statistics, UK output rose by 0.3% in November, following a decline of 0.1% in October. This rebound, which beat economists' expectations of a 0.1% rise, was driven by an increase in industrial output following Jaguar Land Rover's return to full production after its cyberattack and stronger than anticipated growth from the services sector.

As monthly figures can be volatile, ONS prefers to focus on growth across a three-month rolling period and, on this measure, the latest GDP data showed the economy grew by 0.1% in the three months to November. This performance was significantly better than the 0.2% contraction economists had forecast in a Reuters poll, reflecting not only November's upside surprise but also an upward revision to September's growth rate.

The latest evidence from a closely-watched economic survey also provides signs of growing economic momentum, with the preliminary headline growth indicator from S&P Global's UK Purchasing Managers' Index (PMI) jumping from 51.4 in December to 53.9 in January. This represents the fastest overall rate of private sector expansion for just under two years.

Commenting on the survey's findings, S&P Global Market Intelligence's Chief Business Economist Chris Williamson said the data suggests UK businesses "*kicked up a gear*" in January, with firms demonstrating "*encouraging resilience in the face of recent geopolitical tensions*." Mr Williamson also noted that January's flash PMI data was indicative of "*robust quarterly GDP growth approaching 0.4%*" and that the survey puts optimism about the business outlook at its highest level since before the 2024 Autumn Budget.

Inflation rise likely to be temporary

Although recently published ONS data did show that the headline inflation rate rose for the first time in five months, economists do still typically expect price growth to slow sharply across the next few months.

The latest official inflation statistics revealed that the Consumer Prices Index (CPI) 12-month rate – which compares prices in the current month with the same period a year earlier – stood at 3.4% in December. This reading was up from 3.2% in November and slightly higher than the consensus view from a Reuters poll of economists.

ONS noted that tobacco and airfares were the biggest contributors to December's rise. In both cases, though, the change in prices was largely driven by one-off factors like an increase in duty charged on tobacco products forcing the CPI rate higher.

Despite December's rise, most economists expect inflation to slow sharply over the coming months. Indeed, Bank of England (BoE) Governor Andrew Bailey has previously stated his belief that the headline CPI rate is likely to be sitting close to the Bank's 2% target by April or May this year.

Not all members of the BoE's nine-strong interest-rate-setting Committee, however, agree with the Governor's analysis. Megan Greene, for example, recently reiterated that she remains concerned about how much businesses might raise wages this year and the challenge that could pose to the Bank hitting its inflation target.

The outcome of the BoE's next interest rate deliberations is due to be announced on 5 February. A recent Reuters poll found that an overwhelming majority of economists expect Bank Rate to be held steady at that meeting; a slim majority of respondents though did predict a further 25 basis point cut to be sanctioned at the Committee's following meeting in March.

Jobs market remains subdued

The most recent set of labour market data has provided more evidence of a softening in the UK jobs market, with the number of employees on firms' payrolls falling and pay growth edging lower.

Statistics released last month by ONS showed demand for workers continues to wane, with provisional tax data for December revealing a 43,000 monthly fall in the number of people in payrolled employment; this follows a 33,000 drop in November. ONS noted that this decline was concentrated in retail and hospitality reflecting 'weak hiring activity' in these sectors.

The data release also revealed a further slowdown in wage growth with average weekly earnings, excluding bonuses, rising at an annual rate of 4.5% in the three months to November, a slight dip from 4.6% in the previous three-month period. This easing was entirely due to a sharp slowdown in private sector pay increases, which dropped to their lowest level in five years.

Survey evidence also points to more recent weakness. Data from Adzuna's latest survey, for instance, showed that 'competition for roles intensified and hiring slowed' across many sectors in December, while UK PMI data suggests 'the pace of job losses accelerated' across the private sector in January.

Surprise rise in retail sales

Last month's official retail sales statistics revealed an unexpected rise in sales volumes, while survey evidence shows consumer confidence edged up to its highest level since August 2024.

The latest ONS data showed total retail sales volumes grew by 0.4% in December, surprising economists who had predicted a slight fall. This rise represents the first monthly increase since September and marked a brighter end to an otherwise disappointing final quarter, with volumes falling by 0.3% across the last three months of 2025 compared to the previous quarter.

ONS said internet retailing performed well in December, with online jewellers enjoying a particularly strong month boosted by high demand for gold and silver, while there was also a small rise for supermarkets and sales of automotive fuel. Non-food stores, such as department, clothing and household stores, fared less well though, with sales across this sector down 0.9%.

Encouragingly for retailers, last month's GfK survey did report further improvement in consumer morale, with its headline sentiment index rising one point to -16. January's data did, however, mark ten years since consumer confidence was last in positive territory, and GfK Director Neil Bellamy admitted, "we remain a long way from consumers feeling that better days are around the corner."

“ONS said internet retailing performed well in December, with online jewellers enjoying a particularly strong month boosted by high demand for gold and silver”
